

METANETSOFT is a digital engineering consultancy focused on building scalable, high-performance software systems for ambitious companies. We combine product thinking, technical depth, and execution discipline to deliver modern web platforms, real-time applications, cloud-native infrastructure, and AI-enabled solutions. From architecture to deployment, we create resilient digital foundations that prioritize speed, security, maintainability, and measurable business impact.

SKILLS

Core Services	Remote technical consulting, product engineering, system design, architecture planning, digital transformation delivery
Execution	End-to-end project development, scalable application delivery, real-time platform implementation, cloud-native engineering, performance-focused builds
Operations	Client communication, stakeholder management, cross-functional collaboration, technical documentation, agile coordination, delivery oversight
Value Creation	Building resilient digital foundations that improve speed, clarity, scalability, and operational efficiency
Languages	English (Professional), Turkish (Native), German (Professional), Arabic (Professional), French (Professional)

TECHNICAL EXPERIENCE

Healthcare Workforce Systems / Ohshift	Jan 2025 — Present
Client: Ohshift	Austin, Texas, United States (Remote)
- Delivered high-performance Google Cloud Functions and optimized Hasura/PostgreSQL-backed GraphQL pipelines for reliable large-scale data processing. - Strengthened platform security through Firebase Auth and supported SvelteKit interfaces built with TypeScript. - Architected cloud-native foundations for scalable healthcare workforce management systems with focus on reliability, maintainability, and operational continuity. - Implemented real-time synchronization with Cloud Firestore to support seamless multi-user collaboration. - Contributed to mission-critical healthcare applications serving operational teams at scale. - Tech Stack: Google Cloud Functions, Hasura, PostgreSQL, GraphQL, Firebase Auth, SvelteKit, TypeScript, Cloud Firestore	
Hospitality Operations Platform / Arpies Otel	Jun 2024 — Dec 2024
Client: Rise Technology / Arpies Otel	Istanbul, Turkey (Remote)
- Delivered high-performance React applications for hotel operations with strong focus on real-time monitoring, data visibility, and operational efficiency. - Built dashboard interfaces with DevExtreme and custom charting to surface critical hotel metrics and KPIs. - Engineered robust state and data layers with Zustand and TanStack Query for large-scale frontend workflows. - Integrated WebSocket-driven real-time updates and caching strategies to improve responsiveness and runtime performance. - Developed reusable UI and data modules that reduced delivery time for new features by 20–40%. - Tech Stack: React, TypeScript, Node.js, Zustand, DevExtreme, TanStack Query, Microsoft Azure, WebSockets, Kanban	
Real-Time Kiosk & Mobile Platform Delivery / Akeski IT-Solutions	Dec 2022 — Apr 2024
Client: Akeski IT-Solutions	Bavaria, Germany (Hybrid/Remote)
- Delivered four real-time frontends supported by a centralized administrative dashboard controlling shared platform capabilities. - Built mobile and kiosk applications for local branches, including cash, user card, and barcode transaction flows with live data synchronization. - Implemented infinite-scroll data flows and frontend tables to handle high-volume sports event and operational datasets. - Designed a queuing system to batch WebSocket-driven state updates, enabling stable interfaces under high message throughput. - Developed shared service architecture based on observer-pattern principles to improve state reuse across multi-dependent modules. - Delivered backend services to manage 3,600 kiosks across Germany and supported CI/CD foundations across projects. - Tech Stack: React, React Native, TypeScript, Node.js, Jotai, Mantine UI, SignalR Client, React Native Paper, WebSockets, CI/CD, Scrum	
Remote Education Platform Delivery / KCTEK	Jun 2021 — Feb 2023
Client: KCTEK	Kayseri, Turkey
- Delivered frontend capabilities for Qulak Remote Education System, improving usability, interactivity, and day-to-day platform experience. - Integrated MySQL-backed backend services into frontend workflows for stable data handling and synchronization. - Extended backend capabilities with new operational modules, including Mentor Candidate Appointment System. - Supported cross-functional delivery across frontend and backend streams for scalable platform growth. - Tech Stack: React, Three.js, PHP, Laravel, MySQL, Scrum	

FREQUENTLY ASKED QUESTIONS

Can METANETSOFT help us build a new project?

Yes. We support new projects from discovery and technical planning to development, deployment, and post-launch improvement.

Can METANETSOFT support our team if we need additional engineering capacity?

Yes. We work as an extension of internal teams and can provide dedicated support across product engineering, architecture, frontend, backend, mobile, cloud, and delivery operations.

What is your working model?

Our working model depends on project scope, urgency, and delivery structure. We work through hourly consulting, fixed-scope pricing, milestone-based delivery, and long-term collaboration models depending on project needs.

Are we only hiring a service provider?

No. We do more than deliver isolated tasks. We stay involved in delivery quality, technical direction, implementation health, and long-term maintainability to help protect overall project value.

Can you work on an existing project or codebase?

Yes. We regularly step into existing projects, review architecture, improve delivery quality, solve bottlenecks, and continue execution without requiring a full rebuild.

How is pricing structured?

Pricing depends on scope, team composition, and engagement duration. We offer hourly consulting, fixed-price delivery, milestone-based billing, and retainer or dedicated-team models with clear alignment before execution.

How long does a typical project take?

Timeline depends on project size, technical complexity, and decision flow. After initial discovery or review, we provide a phased roadmap with milestones and estimated delivery windows.

Do you provide support after delivery?

Yes. We can continue with maintenance, optimization, feature development, monitoring, and technical guidance after launch based on operational needs.

Who owns source code and intellectual property?

Unless agreed otherwise, clients own approved deliverables, source code, and related documentation after payment terms are fulfilled.

What happens if project scope changes during delivery?

If scope changes, we review impact on timeline, workload, and pricing, then align on an updated plan before continuing. This keeps delivery transparent and predictable.

Do you sign NDAs and protect confidential information?

Yes. We work under NDA when required and treat client information, code, and internal processes as confidential.

Can your team scale up or down during a project?

Yes. Team size and skill mix can be adjusted based on delivery pressure, project phase, and technical requirements.
